MasterLine

MaxxPro® 2F

Insecticide

For use by individuals/firms licensed or registered by the state to apply termicide products. States may have more restrictive requirements regarding qualifications of persons using this product. Consult the structural pest control regulatory agency of your state prior to use of this product. For prevention or control of subterranean termites, drywood termites, dampwood termites, carpenter ants, and other wood-infesting insects.

ACTIVE INGREDIENT:
Imidacloprid,1-[(6-Chloro-3-pyridinyl)methyl]-N-nitro-2-imidazolidinimine ........................................ 21.4%

INERT INGREDIENTS: .......................................................... 78.6%

Total: 100.0%

Contains 2 pounds of imidacloprid per gallon.
Shake well before using.
EPA Reg. No. 432-1331-73748  EPA Est. No. 432-TX-1

Stop - Read the label before use.
Keep out of reach of children.
CAUTION

PARA EL USUARIO: Si usted no lee o entiende inglés, no use este producto hasta que le hayan explicado completamente las instrucciones que figuran en la etiqueta. (TO THE USER: If you cannot read or understand English, do not use this product until the label has been fully explained to you.)

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

Take off contaminated clothing. Have person sip a glass of water if able to swallow. No specific antidote is available. Treat patient symptomatically.

Call a poison control center or doctor for treatment advice.

PRECAUTIONS FOR USE

1. Wear protective eyewear when working in a location where the chemical soil treatment can be inadvertently ingested or inhaled. Following mixing and application, soil treated with I MaxxPro 2F solution can be expected to foam slightly when washed with water. The foam is non-toxic and will settle within minutes. Avoid inhaling foam generated by mixing or application. Full Personal Protective Equipment (PPE) is not required for application when using large sprayer, start pump to begin application. Refer to Mixing Table for proper mixing table to determine the amount of I MaxxPro 2F per 10 linear feet. For example, if an area to be treated during application and entrance platforms is determined, it is a violation of Federal law to use this chemical soil treatment for termite control. Do not apply at a lower dosage and/or concentration than specified on this label for the treatment of termite infestations.

APPLICATION VOLUME

APPLICATIONS

1. Application shall be made in the ground in voids below grade, adjacent to interior and exterior foundation walls, supporting piers, plumbing and utility services which penetrate the slab. Apply 4 gallons of solution to accurately and uniformly coat the treated zone in the voids at the footing. It is recommended that the treated zone in the voids at the footing be at least 6 inches wide and 6 inches deep when rod holes are to be drilled using a drill press. Hold the drill bit perpendicular to the footing and drill down in a series of passes until at least the top of the footing or soil is reached. Rodding can be done from the bottom of a narrow trench approximately 6 inches wide (Rod hole depth should not exceed 12 inches) and 18 inches wide horizontally, to be deposited along the inside of foundation walls, and along the perimeter of the footing. When rodding, rod holes shall be spaced in a manner preventing subsequent collapse of the trench. The distance between rod holes shall not exceed 12 inches and the rate of 1 gallon of solution per 10 square feet to provide a uniform application adjacent to interior foundation walls and along the perimeter of the footing. The treated zone shall extend 2 feet from the foundation walls. Steam injection and rodding are recommended for soil under house foundations, basements, crawl spaces, and under house structures. Do not contaminate wells or cisterns with I MaxxPro 2F solution (see table for foaming rate for specific application sites). Do not allow water to enter the structure, if the pipe(s) enter the structure, if the pipe(s) enter the structure. Use suitable sealant. Plugs and other suitable equipment to apply a continuous treated zone.

2. Treat infested and/or damaged wood in structures with Wells/Cisterns Inside. Drill holes should be spaced in a manner preventing subsequent collapse of the trench. The distance between drill holes shall not exceed 12 inches and the rate of 1 gallon of solution per 10 square feet to provide a continuous treated zone.

TREATMENT AROUND WELLS OR CISTERNS

Ventilation systems in buildings shall be isolated during treatment with I MaxxPro 2F solution. Do not contaminate heat or air conditioning ducts and vents. Plug and tape these openings.

CRAWL SPACES:

The treated area. Rod hole depth should not exceed 12 inches, to be deposited along the inside of foundation walls, and along the perimeter of the footing. When rodding, rod holes shall be spaced in a manner preventing subsequent collapse of the trench. The distance between rod holes shall not exceed 12 inches and the rate of 1 gallon of solution per 10 square feet to provide a continuous treated zone.

PLENUMS:

The treated area. Rod hole depth should not exceed 12 inches, to be deposited along the inside of foundation walls, and along the perimeter of the footing. When rodding, rod holes shall be spaced in a manner preventing subsequent collapse of the trench. The distance between rod holes shall not exceed 12 inches and the rate of 1 gallon of solution per 10 square feet to provide a continuous treated zone.

MASONRY:

Materials resting on the footing may be treated with 3 gallons of I MaxxPro 2F solution. Do not contaminate wells or cisterns with I MaxxPro 2F solution. Do not allow water to enter the structure. Use suitable sealant. Plugs and other suitable equipment to apply a continuous treated zone.

Do not contaminate wells or cisterns with I MaxxPro 2F solution. Do not allow water to enter the structure. Use suitable sealant. Plugs and other suitable equipment to apply a continuous treated zone.

Structures With Wells/Cisterns Inside

Drill holes should be spaced in a manner preventing subsequent collapse of the trench. The distance between drill holes shall not exceed 12 inches and the rate of 1 gallon of solution per 10 square feet to provide a continuous treated zone.

All leaks resulting in the deposition of termiticide in locations other than those pre-determined shall be treated. Applicators must inspect areas of possible presence of subterranean termites. Do not allow water to enter the structure. Use suitable sealant. Plugs and other suitable equipment to apply a continuous treated zone. Structures with Wells/Cisterns Inside

An application should be made by trenching referring to Federal Housing Administration requirements. Rodding can be done from the bottom of a narrow trench approximately 6 inches wide (Rod hole depth should not exceed 12 inches) and 18 inches wide horizontally, to be deposited along the inside of foundation walls, and along the perimeter of the footing. When rodding, rod holes shall be spaced in a manner preventing subsequent collapse of the trench. The distance between rod holes shall not exceed 12 inches and the rate of 1 gallon of solution per 10 square feet to provide a continuous treated zone.

A suitable sealant shall be used to apply a continuous treated zone. Structures with Wells/Cisterns Inside

Drill holes should be spaced in a manner preventing subsequent collapse of the trench. The distance between drill holes shall not exceed 12 inches and the rate of 1 gallon of solution per 10 square feet to provide a continuous treated zone.

All leaks resulting in the deposition of termiticide in locations other than those pre-determined shall be treated. Applicators must inspect areas of possible presence of subterranean termites. Do not allow water to enter the structure. Use suitable sealant. Plugs and other suitable equipment to apply a continuous treated zone.
Harmful if swallowed, inhaled, or absorbed through skin.

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

If on Skin • Wash the exposed area with soap and water. If irritation persists, seek medical attention.

If in Eyes • Remove contact lenses, if possible. Wash the exposed area gently with water for 15 minutes, or until the pain subsides. If pain persists, seek medical attention.

If in Mouth • Do not induce vomiting unless told to do so by a poison control center or doctor. Loosely hold the jaw, lean the head forward, and force the person to swallow a small amount of water. Seek medical attention.

IN CASE OF ACCIDENT

Do not give anything by mouth to an unconscious person. Do not induce vomiting unless told to do so by a poison control center or doctor. Loosely hold the jaw, lean the head forward, and force the person to swallow a small amount of water. Seek medical attention.

PRECAUTIONARY STATEMENTS

Do not give anything by mouth to an unconscious person. Do not induce vomiting unless told to do so by a poison control center or doctor. Loosely hold the jaw, lean the head forward, and force the person to swallow a small amount of water. Seek medical attention.

PROTECTIVE CLOTHING AND EQUIPMENT

When using this product, protective clothing and equipment should be worn. Use a respirator for protection against dust, fumes, mists, and gases. In case of local漫浸, equipment for eye protection must meet the requirements of the OSHA Bloodborne Pathogens Standard and the ANSI Z87.1-2015 requirements for personal protective eyewear. Use personal protective equipment appropriate for the workplace or the location of the spill.

APPLICATION VOLUME

It is recommended that application volumes be determined in accordance with label directions. The application volume should be based upon the area to be treated and the concentration of the product. The application volume should be sufficient to ensure that the product is applied to the surface of the soil or substrate being treated. The application volume should be determined by multiplying the area to be treated by the product concentration.

PRE-CONSTRUCTION TREATMENT

Trenching and treatment of backfill may provide a better opportunity to achieve a continuous treated zone. Treatment under the slab, including attached garages and similar slab structures, may not be treatable or may require additional treatment. Treatment of voids in block or rubble foundations should only be done by the backfill method. Treat soil between 5 and 6 feet deep. Use a low pressure spray to treat soil taking care to contain the liquid and prevent runoff or spillage. Coarse spray on the soil, wood and structure is recommended. The surface application will be made at a rate of 1 gallon of solution per 10 square feet. An access door may be necessary around sewer pipes, floor drains that could empty into any bodies of water. Structures that contain wells may require additional treatment procedures. The soil should be treated by trenching or trenching and rodding. Mix the spray solution with soil as needed) between the wood and other cellulose material in the structure and the termite treated zone. Rodding may be done from the trench along the outside foundation should be spaced in a manner that will allow for application of a continuous treated zone. Treat all existing cracks and cold, concrete or masonry surfaces. Treatment of other areas such as crawl spaces, plenums, and wells and cisterns may be required.

DIRECTIONS FOR USE

This product is highly toxic to aquatic invertebrates, landscape modifications, and/or terrestrial invertebrates. It is a violation of Federal law to use this product in a manner inconsistent with its labeling. It is the responsibility of the applicator to follow the instructions on the label. The product should be applied in accordance with label directions. The product should be applied in such a manner that it is not applied to the surface of the soil or other substrate to be treated. The product should be applied only to the soil or other substrate to be treated. The product should be applied at a concentration not to exceed the concentration specified on this label for the particular use. The product should be applied at a concentration not to exceed the concentration specified on this label for the particular use.

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

MIXING:

- Mix using a pump sprayer, pressure sprayer, foamer, or similar equipment.
- Use a small, non-metallic container to mix I Maxx Pro 2F.
- Do not use a pump sprayer or pressure sprayer to mix with water.
- Use a sprayer that produces a fine mist or atomized spray.

FIRST AID:

- In case of contact with eyes, rinse immediately with plenty of water for 15 to 20 minutes.
- For skin contact, wash with soap and water for 15 to 20 minutes.
- In case of ingestion, call a poison control center or doctor for treatment advice.
- No specific antidote is available. Treat patient symptomatically.

SITES:

- For subterranean termites:
  - Structures that contain wells or cisterns:
    - Mix and apply solution per 10 linear feet. For example, if 0.05% is the correct use rate to be applied, accept application of 4 gallons of I MaxxPro 2F, which will be placed in the trench, mixing described in the I MaxxPro 2F "DIRECTIONS FOR USE".
  - After application, the applicator is required to:
    - Inspect treated areas and determine whether application of the termiticide is necessary.
    - Notify the general contractor, construction staff, or property owner of the application prior to installation of the finish tool when the valve is open) to treat reaches the footing by injecting into the lower areas of the wall, just above the floor or footing.
- For soil near termite colonies:
  - Use a pressure sprayer (not to exceed 25 psi at the treatment tool when the valve is open) to treat at the rate prescribed on this label.
  - Structures that contain wells or cisterns:
    - Mix and apply solution per 10 linear feet to provide a uniform application volume. Ensure the treated zone to be deposited along the treated areas with a suitable sealant. Plugs must be applied to the trench and mixed with the solution per 10 linear feet. For example, if 0.05% is the correct use rate to be applied, accept application of 4 gallons of I MaxxPro 2F, which will be placed in the trench, mixing described in the I MaxxPro 2F "DIRECTIONS FOR USE".
- For above ground colony:
  - Mix and apply solution per 10 linear feet to provide a uniform application volume. Ensure the treated zone to be deposited along the treated areas with a suitable sealant. Plugs must be applied to the trench and mixed with the solution per 10 linear feet. For example, if 0.05% is the correct use rate to be applied, accept application of 4 gallons of I MaxxPro 2F, which will be placed in the trench, mixing described in the I MaxxPro 2F "DIRECTIONS FOR USE".
- For perimeter:
  - Mix and apply solution per 10 linear feet to provide a uniform application volume. Ensure the treated zone to be deposited along the treated areas with a suitable sealant. Plugs must be applied to the trench and mixed with the solution per 10 linear feet. For example, if 0.05% is the correct use rate to be applied, accept application of 4 gallons of I MaxxPro 2F, which will be placed in the trench, mixing described in the I MaxxPro 2F "DIRECTIONS FOR USE".
- For untreated soil:
  - Mix and apply solution per 10 linear feet to provide a uniform application volume. Ensure the treated zone to be deposited along the treated areas with a suitable sealant. Plugs must be applied to the trench and mixed with the solution per 10 linear feet. For example, if 0.05% is the correct use rate to be applied, accept application of 4 gallons of I MaxxPro 2F, which will be placed in the trench, mixing described in the I MaxxPro 2F "DIRECTIONS FOR USE".

WATER:

- Do not treat soil that is water-saturated or frozen or in any conditions where run-off or spillage could occur. Do not apply directly to water, to sewers, storm drains, or cesspools.
- Apply only to soil or other fill substrate that is not water-saturated and not frozen.
- Structures that contain wells or cisterns:
  - Mix and apply solution per 10 linear feet with the rate prescribed on this label. It is a violation of Federal law to use this product in a manner not consistent with its labeling.
- Structures that contain wells or cisterns:
  - Mix and apply solution per 10 linear feet at the rate prescribed on this label. It is a violation of Federal law to use this product in a manner not consistent with its labeling.
- Structures that contain wells or cisterns:
  - Mix and apply solution per 10 linear feet at the rate prescribed on this label. It is a violation of Federal law to use this product in a manner not consistent with its labeling.
- Structures that contain wells or cisterns:
  - Mix and apply solution per 10 linear feet at the rate prescribed on this label. It is a violation of Federal law to use this product in a manner not consistent with its labeling.

- Structures that contain wells or cisterns:
  - Mix and apply solution per 10 linear feet at the rate prescribed on this label. It is a violation of Federal law to use this product in a manner not consistent with its labeling.
HAZARDS TO HUMANS AND DOMESTIC ANIMALS: Do not contaminate water when disposing of equipment wash water or leftovers. Make treatment until location of vents and air conditioning ducts and vents are known and identified. Use heat or air conditioning ducts and vents. See Pre-Construction Treatment for vented structures.

People present or residing in the structure must be informed of the chemical treatment to control subterranean termites and that the structure will be treated. Actual treatment must be confined to the structure without omission. Quick evaporation of the liquid formulation and limited spread of the chemical is achieved through use of foam generating techniques. Foam application may be made alone or in combination with conventional application techniques (described above) can also be used.

Personal Protective Equipment

All pesticide handlers (mixers, loaders, and applicators) must wear protective clothing and equipment suitable for the conditions. In addition, all pesticide handlers must wear protective clothing and equipment required by the regulations of the Occupational Safety and Health Act of 1970. All pesticide handlers must wear resisting gloves made of waterproof material. It is a violation of Federal law to use this end-use product if the handlers fail to follow the instructions on the label for personal protective equipment. Employers are responsible for providing and maintaining the necessary protective equipment and clothing for their employees. Therefore, employers must provide, maintain, and monitor the use of this protective equipment for their employees. The mixers, loaders, and applicators must check for leaks. All leaks resulting in the deposition of termiticide in locations other than those prescribed in this label must be cleaned up prior to leaving the application site.

Pesticide handlers must use resistant gloves made of waterproof material that do not allow penetration of the active ingredient by a concentration of at least 0.3 fl oz. The glove material must be impervious to the active ingredient as determined by the glove manufacturer and must be resistant to all media through which the active ingredient may pass. All pesticide handlers (mixers, loaders, and applicators) must wear personal protective equipment, including but not limited to, protective clothing and footwear, as required. The use of additional personal protective equipment (e.g., respirator, chemical splash goggles) may also be necessary in some cases. Personal protective equipment (PPE) that has failed the performance test or is damaged must be replaced before use.

Swallowed: • If taken internally, immediate medical advice must be sought. • Do not induce vomiting. • Give 2 cups of water or milk if swallowed. • Consult a physician immediately.

Inhalation: • Remove to fresh air. • Loosen tight clothing and remove if necessary. • If a physician is consulted, the label or container should be brought along.

Skin Contact: • Wash thoroughly with soap and water. • Remove contaminated clothing. • Wash contaminated clothing before reuse. • Consult a physician immediately.

Rinse Eyes: • Immediately flush eyes with large amounts of water for 15 minutes. • Consult a physician immediately (only for prolonged exposure).

In the event of a spill:

1. Do not apply within 5 feet of any well or cistern. Do not use in areas where water is obtained from a well or domestic water supply if the water is not treated and disinfected to prevent contamination. If commercially available water treatment is not available, notify the appropriate authorities to prevent surface access by termites. Apply 4 gallons of solution per square foot. An access door into the house must be sealed with tar or a similar type sealant beneath and extend below the footing. Do not contaminate wells or cisterns. When the top of the footing is exposed, do not contaminate the drain and extend below the footing. To prevent subterranean termites from con- tinuing in the voids at the footing, drill holes in commonly occupied areas of the structure, apply the dilution at the rate of 0.05% on the soil surface within 3 feet of grade. Drill spac- ing should be 15 inches. Drill holes must be spaced in a manner that will provide a uniform treated zone, not to exceed 12 inches, to be filled with treated soil after the holes are made. All leaks resulting in the deposition of termi- cide in locations other than those prescribed in this label must be cleaned up prior to leaving the application site (refer to Pre-Construction Treatment for vented structures). Structures that contain wells must be treated below the footing.

2. Prior to treatment, applicators are advised to check for leaks. All leaks resulting in the deposition of termiticide in locations other than those prescribed in this label must be cleaned up prior to leaving the application site. When treating foundations deeper than 4 feet, utilizing the backfill method, the treated backfill technique can be used. Treat soil between 5 and 27.5 feet from the foundation using a coarse spray on the soil, wood and structure being placed in the trench. Combination with conventional application techniques (described above) can also be used.

3. Do not apply within 5 feet of any well or cistern. Do not use in areas where water is obtained from a well or domestic water supply if the water is not treated and disinfected to prevent contamination. If commercially available water treatment is not available, notify the appropriate authorities to prevent surface access by termites. Apply 4 gallons of solution per square foot. An access door into the house must be sealed with tar or a similar type sealant beneath and extend below the footing. Do not contaminate wells or cisterns. When the top of the footing is exposed, do not contaminate the drain and extend below the footing. To prevent subterranean termites from con- tinuing in the voids at the footing, drill holes in commonly occupied areas of the structure, apply the dilution at the rate of 0.05% on the soil surface within 3 feet of grade. Drill spac- ing should be 15 inches. Drill holes must be spaced in a manner that will provide a uniform treated zone, not to exceed 12 inches, to be filled with treated soil after the holes are made. All leaks resulting in the deposition of termiticide in locations other than those prescribed in this label must be cleaned up prior to leaving the application site (refer to Pre-Construction Treatment for vented structures).

4. Prior to treatment, applicators are advised to check for leaks. All leaks resulting in the deposition of termiticide in locations other than those prescribed in this label must be cleaned up prior to leaving the application site. When treating foundations deeper than 4 feet, utilizing the backfill method, the treated backfill technique can be used. Treat soil between 5 and 27.5 feet from the foundation using a coarse spray on the soil, wood and structure being placed in the trench. Combination with conventional application techniques (described above) can also be used.
During application must be advised to exposures to persons occupying the struc-
taminated clothing and wash before reuse. soap and water after handling. Remove con-

<p>BLACK BAYER ENVIRONMENTAL SCIENCE</p>

The label provides instructions on how to use the product safely and effectively. It includes the following sections:

1. **WARNING:**
   - Using this product incorrectly could result in injury to the operator or bystanders.
   - Always read and follow the instructions and warnings on the label.

2. **INSTRUCTIONS FOR USE:**
   - Follow the application and mixing guidelines provided on the label.

3. **APPLICATIONS:**
   - The label provides details on the types of structures that can be treated, including foundations, basements, and plenums.

4. **MIXING TABLE FOR I MAXXPRO 2F:**
   - A table showing the recommended mixing ratios for different volumes of solution.

5. **SAFETY PRECAUTIONS:**
   - Wear appropriate personal protective equipment (PPE) when handling the product.
   - Keep the product out of reach of children and pets.

6. **DISPOSAL:**
   - Dispose of the product according to local regulations.

7. **TECHNICAL INFORMATION:**
   - This section contains additional technical details about the product, such as its ingredients and other relevant information.

The label also includes specific instructions on how to treat different areas of a structure, as well as information on how to contact emergency medical services if needed.
remove their pets and themselves from the structure. People present or residing in the structure, the applicator must check the area to be treated until dry. Keep children or pets away from treated area.

**CAUTION:** Harmful if swallowed, inhaled, or absorbed through skin.

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

If on Skin • Have person sip a glass of water if able to swallow. No specific antidote is available. Treat patient symptomatically.

Have the product container or label with you when calling a poison control center or doctor.

If on Eyes • Rinse eyes or irrigation shower very thoroughly with water. Consult a physician or the poison control center. Avoid further contact until medical assistance arrives.

If swallowed • Rinse mouth and do not induce vomiting. Get medical help immediately.

If inhaled • Remove to fresh air and consult a physician or the poison control center. Do not induce vomiting. Avoid further contact until medical assistance arrives.

**NOTICE:** Do not wash or launder clothing or shoes that have been contaminated with this product. Contact your local authorities for proper disposal method.

**HAZARDS FOR PERSONNEL**

Wear long-sleeved shirt, long pants, socks, shoes, and chemical-resistant gloves made of waterproof material (e.g., polyvinyl chloride or viton). After product application, wash hands and other exposed skin areas immediately with soap and water. Do not eat, drink, or smoke when handling this product. Properly dispose of used clothing, shoes, and gloves. Do not wear jewelry or other items which could be contaminated. Wash contaminated clothing, shoes, and other articles after use. Do not re-use contaminated items.

**PRE-CONSTRUCTION TREATMENT**

The equipment washwaters may contaminate soil which will be placed into the trench after installation. When treatment is provided, the trench must be checked for leaks. All leaks resulting in the deposition of termiticide in locations other than the structure are to be corrected. The applicator must check the treated area after each treatment, and the applicator must check all treated areas before reoccupancy. Care must be taken to avoid reapplication of termiticide in the treated area.

**APPLICATIONS:**

**BASEMENTS - INSIDE PERIMETER:**

Application must be made at the perimeter of the footing. However, in no case should a width of 18 inches, horizontally, be necessary around sewer pipes, floor drains, conduits, expansion joints or any mechanical alteration prior to treatment. Structures with adjacent wells/cisterns may not be treatable or may require isolation and redrilling by a licensed contractor. Use a low pressure spray to treat soil as it is placed in the trench.

**STRUCTURES WITH/WITHINSIDE PERIMETER:**

Structures with wells/cisterns inside the building with a suitable sealant. Plugs may be made, but the treated strip shall not exceed a width of 18 inches, horizontally, when there is insufficient space to allow for application of a uniform treated zone. Use a low pressure spray to treat soil as it is placed in the trench.

**HOLLOW BLOCK FOUNDATION OR VOIDS:**

Structures with adjacent wells/cisterns may be treated by rodding and/or trenching or by combination with conventional application method.

**IN-LINE-INJECTION:**

For the desired application rate for specific application sites. Add appropriate amount of I MaxxPro foam alone or in combination with conventional application method.

For the desired application rate for specific application sites. Add appropriate amount of I MaxxPro foam alone or in combination with conventional application method.
Applications may be made behind veneers, unfinished basements, or inaccessible areas by drilling, and then injecting the suspension or foam with a suitable treatment tool with a splashback guard. It is recommended to remove or prune away any form of vegetation that may attract insects, mechanical sounding techniques, or listening devices (e.g., stethoscopes, acoustic emission detectors). Penetrate any cracks or crevices, galleries, or spaces where ants are tunneling beneath the surface, by drilling or by injecting a 0.05 to 0.1% solution or sufficient volume of foaming agent to provide foam of the desired expansion ratio. Reduce the effectiveness of the treated zone if nests are found in localized areas, apply a 0.05 to 0.1% solution or sufficient volume of foaming agent. Retreat as needed to maintain protection. For non-structural wood-to-soil contacts, termite carton nests in wood or wall voids. Termite carton nests in soil may be injected with a 0.05 to 0.1% solution. Retreat as needed to maintain protection. For larger constructions, apply 4 inches along the perimeter of the soil barrier (about 20 psi) spray or by misting, or pellets, blistered wood, emergence or emergence holes. When a structure is not known to be reinfested, or treatment practices for areas in close proximity to the structure may offer a route of entry for reinfestation or treated zone disruption, apply a 0.05 to 0.1% solution applied to the structure. Read and follow all label directions. Do not use this product against native or imported termite species. Before applying, always check for signs of termites before making treatment decisions. Do not allow residents or pets into the treatment area. Keep out of reach of children and pets. CAUTION: Use anti-backflow equipment or an air gap in bath traps, expansion joints, foundation cracks or drilled holes where these ants or their nests are present. Termites can be treated with sprays, mists, or foams where ants are tunneling beneath the surface. Treated homes are usually sprayed or misted with a 0.05 to 0.1% solution applied to the structure. The treated zone must extend to the bottom of the termiticide treated zone in the soil. For small trees (< 6 inches in diameter), inject the soil, turf, and ground cover adjacent to the building with a 0.05 to 0.1% solution. For protection of buildings, porches, patios and other structures, apply by brushing or as a spot treatment to critical areas of the structure. It is recommended to remove or prune away any form of vegetation that may attract insects, mechanical sounding techniques, or listening devices (e.g., stethoscopes, acoustic emission detectors). Penetrate any cracks or crevices, galleries or structure voids where ants are tunneling beneath the surface. Apply a 0.05 to 0.1% solution or sufficient volume of foaming agent to provide foam of the desired expansion ratio. Reduce the effectiveness of the treated zone if nests are found in localized areas, apply a 0.05 to 0.1% solution or sufficient volume of foaming agent. Retreat as needed to maintain protection. When a structure is not known to be reinfested, or treatment practices for areas in close proximity to the structure may offer a route of entry for reinfestation or treated zone disruption, apply a 0.05 to 0.1% solution applied to the structure. Read and follow all label directions.

Do not use this product against native or imported termite species. Before applying, always check for signs of termites before making treatment decisions. Do not allow residents or pets into the treatment area. Keep out of reach of children and pets. CAUTION: Use anti-backflow equipment or an air gap in bath traps, expansion joints, foundation cracks or drilled holes where these ants or their nests are present. Termites can be treated with sprays, mists, or foams where ants are tunneling beneath the surface. Treated homes are usually sprayed or misted with a 0.05 to 0.1% solution applied to the structure. The treated zone must extend to the bottom of the termiticide treated zone in the soil. Read and follow all label directions.
IMAXX PRO 2F 27.5 79366280C 070719B ETL 033010

IMAXX PRO 2F is a foam concentrate designed for use in termite control applications.

Use and Application:

- For prevention or control of subterranean termites, drywood termites, dampwood termites, carpenter ants, house borers, wharf borers, or ambrosia or blister beetles.
- Apply a 0.05 to 0.1% IMAXX Pro 2F solution or sufficient volume to produce foam of the desired expansion ratio.
- Depending on the circumstances, foam can be directed into block voids or structural voids, piers, chimney bases, into rubble foundations, where wood is in contact with soil, and between wooden structural members and between wooden members of structures above ground.
- It is recommended to remove or prune away infested objects that may provide a pathway for termites, such as firewood or other wood materials.
- Cleaning out holes, the presence of live termites (e.g., posts, fences, decks), and emergence or infestation points to varying depths may be necessary.
- For localized treatment for carpenter bees, apply a 0.05 to 0.1% IMAXX Pro 2F solution to carpenter bee nests.
- The exterior terraces of the soil may provide a route of entry for these pests, so it is recommended to remove or prune away infested objects that may provide a pathway for termites.

Volume and Active Ingredient:

- The volume of IMAXX Pro 2F to use depends on the area to be treated and the depth of penetration required.
- For localized treatment of above-ground termites and localized areas, apply a 0.05 to 0.1% solution or sufficient volume to produce foam of the desired expansion ratio.
- For larger constructions, apply 4 gallons per 10 square feet to prevent infestations.
- For small trees (< 6 inches in diameter), apply 2 gallons per 10 linear feet per foot of depth.
- For small poles or posts (< 6 inches along the perimeter of the soil), apply 4 gallons per 10 linear feet per foot of depth.
- It is recommended to remove or prune away infested objects that may provide a pathway for termites, such as firewood or other wood materials.

Handling:

- When applying IMAXX Pro 2F, it is recommended to use an appropriate injection system to direct the foam into the targeted area.
- It is important to note that the foam should not be allowed to contact potable water supplies.
- Use anti-backflow equipment or an air gap when necessary.
- When disposing of the container, it is important to follow the disposal instructions provided on the label and to avoid any potential hazards.

Precautions:

- It is essential to follow all relevant state, local, and federal regulations regarding the use of IMAXX Pro 2F.
- The use of this product must be supervised by a licensed or registered pest management professional.
- Do not allow residents or pets into the immediate area during the application or treatment.
- Care must be taken to avoid puncturing the container or mixing with other materials.
- When disposing of the container, it is important to follow the disposal instructions provided on the label and to avoid any potential hazards.

**Limitations of Liability:**

- Univar USA, Inc. makes no other warranties, representations, or guarantees, expressed or implied, of any kind, with respect to the product or any other matter, written or oral.

**PESTS**

- This product is intended for use as a protective treatment to control pest infestations of or to prevent infestation by termites, ants, and other wood-infesting insects.
- It is desirable to physically remove carton nests from wooden structural members and between in damaged wood, and in spaces between termite carton nests in above ground locations, into block voids or structural voids, and amount of active ingredient are essential to effective treatment.
- Add the manufacturer's recommended quantity of foam agent to the I MaxxPro 2F solution.
- **FOAM EXPANSION**
  - Use a 0.05 to 0.1% solution or foam. Multiple injection treatments may be repeated in accordance with label directions. When spraying overhead in living areas, cover the surface to the point of wetness, and coarse, low pressure (about 20 psi) spray to penetrate the wood surface; apply sufficient volume to maintain protection. Plastic sheeting or similar material should be used. In some instances, a perimeter application is necessary for effective treatment.
- **GENERAL PRECAUTIONS FOR APPLICATION PROCEDURES**
  - Be aware that the use of this product may cause mutual exclusion of pest species. The use of this product alone or in combination with other pest control products may cause a variation in pest behavior.
  - This product is not intended to be used as a fumigant or dusting agent. The use of this product as a fumigant or dusting agent is not recommended.
  - When using this product, always follow the instructions on the label for the specific pest control situation.
  - Do not apply this product in a manner that will cause it to drift onto vegetation touching or in close proximity to the structure. Vegetation touching or in close proximity to the structure should be removed or covered with plastic sheeting or similar material. Avoid spraying vegetation touching or in close proximity to the structure.
  - When using this product, always follow the instructions on the label for the specific pest control situation.
  - Do not contaminate water, food, or feed by using this product near or in bodies of water. Do not contaminate water supplies.
  - Always wash hands before eating, drinking, or smoking.

**SAFETY PRECAUTIONS**

- **READ LABEL BEFORE USE**
  - **CAUTION:** This product is harmful if inhaled or swallowed. Keep out of reach of children.
  - **DANGERS:** This product is intended for use by trained professionals only. Do not contaminate water, food, or feed by using this product near or in bodies of water. Do not contaminate water supplies.
  - **FIRST AID:** If swallowed, call a Poison Control Center or physician immediately. Do not induce vomiting. Do not give anything by mouth unless instructed to do so by a physician or Poison Control Center. If inhaled, move to a fresh air area. If on skin, wash thoroughly with soap and water. If on eyes, rinse with water. Do not use near drainage points.
  - **Pesticide Storage:** Keep out of reach of children and pets. Keep out of reach of children. Store in original container in a cool, dry place away from food and food storage areas. Do not use or store this product near food or food storage areas.
  - **DISPOSAL:** If the container is damaged or punctured, do not reuse. Do not contaminate water, food, or feed by using this product near or in bodies of water. Do not contaminate water supplies.

**IMPROVE YOUR HOME'S RESILIENCE TO PESTS**

- **ECONOMICAL SOLUTION:** This product provides a cost-effective solution to pest control problems. It is recommended for use in situations where pest control is needed.
- **ENVIRONMENTAL BENEFITS:** This product is environmentally friendly and uses a Minimum Risk Pesticide. It is recommended for use in situations where pest control is needed.
- **LABEL DIRECTIONS:** Follow the instructions on the label for the specific pest control situation.

**PRODUCT INSTRUCTIONS**

- **APPLY SOLUTION OR FOAM:** Use a 0.05 to 0.1% solution or foam. Multiple injection treatments may be repeated in accordance with label directions. When spraying overhead in living areas, cover the surface to the point of wetness, and coarse, low pressure (about 20 psi) spray to penetrate the wood surface; apply sufficient volume to maintain protection. Plastic sheeting or similar material should be used. In some instances, a perimeter application is necessary for effective treatment.

**IMPORTANT SAFETY INFORMATION**
