

Yard Guard Products - Instructions for Use

How To Apply

Yard Gard is easily applied using any type of broadcast or drop spreader. For convenience, you can purchase our Shaker Container,

- which allows you to apply the material without purchasing a spreader.

Yard Gard should be applied according to the instructions on the container.

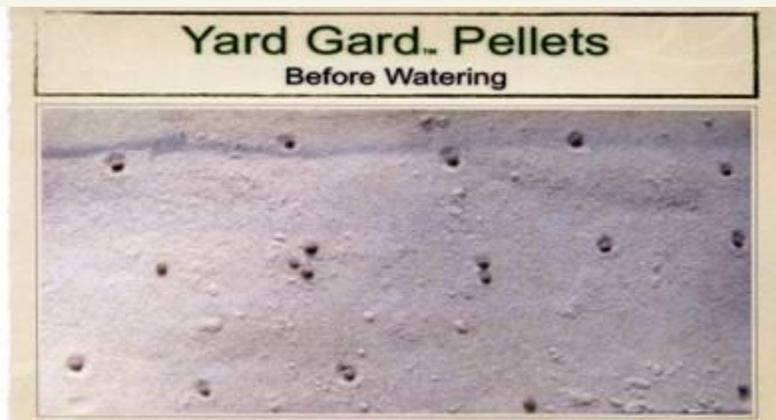

- Simply apply the granules to your yard or garden and water the application area for 30 minutes.
- After five days, water the application area again and watch as the animals leave for months.

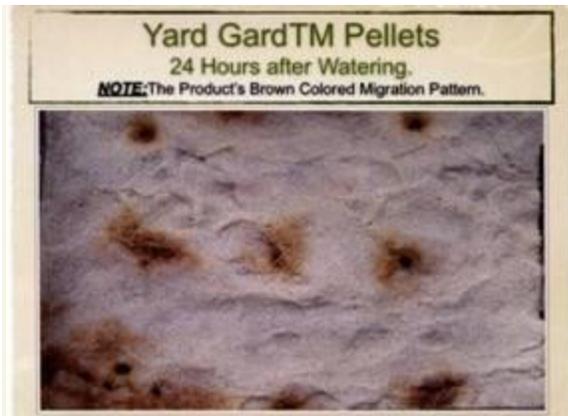

For guaranteed results Yard Gard must be applied based on the heavy infestation application rates.

- (Area of coverage are listed below and listed under the "Product" tab.)

*Note: Yard Gard granules must reach the soil surface;

- therefore your yard may need to be dethatched if it is covered with dead vegetation, grass, and debris that is greater than two inches in thickness.

What Makes Yard Gard Work

Yard Gard, unlike many of our competitors, gives our customers coverage rates that are for "full yard" coverage.

Many repellents only use methods such as perimeter application, which is only effective if the animals happen to cross the perimeter that is applied.

Yard Gard covers the entire yard and deters armadillos, moles, skunks, groundhogs, gophers, and many other digging animals in every square foot. To determine the way the coverage rate is to be applied, look at the units of the application number on their package.

If the applied units are measured in linear feet (l.f.) then you know that it is only perimeter coverage.

Yard Gard is also more effective because of our unique blend of ingredients.

We do not use only one simple ingredient to repel digging animals but we use a blend of several ingredients that uses the animal's keen sense of smell and taste to drive them away.

Yard Gard is also free from predator urine, which can bring fear and confusion to pets.

Yard Gard animal repellent also effectively, deters digging critters for the longest period of time because of our innovative time-release formula. Yard Gard gradually releases its powerful formula into the soil so that armadillos, moles, skunks, gophers, groundhogs, chipmunks, skunks and other digging critters are conditioned to stay away.

Yard Gard is not a liquid which can be washed away with rain and thereby allows those annoying yard destroying animals to return shortly after application.

Yard Gard is the most effective product on the market.

We have tested our product extensively and can with complete confidence tell you and guarantee you that we are the product that "works."

Yard Gard Recommended Coverage Rates

Yard Gard animal repellents publish full yard coverage rates.

Many of our competitors publish unrealistic coverage rates or merely account for perimeter application.

If a product promotes itself as a animal fence or publishes coverage rates in linear feet (l.f.) then it is probably a perimeter application and not a full yard coverage like Yard Gard.

Our product is not only a full yard coverage but has coverage rates that are realistic to actually deter the critters that are digging in your yard.

Below are the coverage rates for our containers and how they should be applied for the correct ingredient concentration into the soil at 4 lbs product for each 1000 sq ft of lawn area.:

Small Yard: 4 lb. Package - Coverage up to 1,000 sq. ft.

Medium Yard: 8 lb. Package - Coverage up to 2,000 sq. ft.

Large Yard: 20 lb. Bag - Coverage up to 5,000 sq. ft.
